How to use: smFISH_plot_editor.py

Change the look and text of every SuperPlot interactively, show subsets of probes, exclude replicates (statistics recomputed) and export publication files - without rerunning any analysis. pipeline version 4 (October 2026).

> **Needs:** smFISH_statistics_superplots.py (latest) in the same folder; for the dendrite-vs-axon figure also smFISH_compartments_and_areas.py. Run the statistics (and optionally advanced) scripts first.

1. Starting

```
python smFISH_plot_editor.py
-> select the _density_results folder
```

The Figure menu lists what exists: Density control vs protease, Density DIV9 vs DIV27, Area check, Dendrite vs axon, Advanced metrics (DIV and control/protease). Choose statistics (robust model / t-tests), figure and panel at the top left; every change redraws immediately.

2. Tabs

Tab	Contents
Data	probes shown; replicates included (unticked = removed from plot AND statistics, recomputed); "robust model: fit only the shown probes"; note on graph; export statistics of this figure
Text	panel title and y label (per panel; y label for all panels), font, group labels (Ctrl → Control ...), probe names, legend names of replicates
Axes	axis/tick widths and lengths, font sizes, panel size, spacing
Y axis	min, max, tick step per panel; percentile zoom; log scale
Points	image dots, mean symbols, connecting lines, show images / legend
Colours	colour and symbol per replicate; mean edge and bar colours
Summary	SD/SEM/none; stars / p / both / none; ns on/off; bracket style

3. Exporting

- **Export this panel** - PDF/SVG/PNG/TIFF at the exact size (text editable in PDF/SVG).
- **Export all panels** - every panel of the figure as PDF + PNG.
- **Export whole figure** - all panels in one file.
- **Save / Load style** - all settings, texts, per-panel y ranges, probe and replicate selection in one .json.

4. Excluding a replicate

> Allowed for a documented technical reason (e.g. overdetection on one camera). The note "excluded: n..." is printed under exported panels by default; the exported statistics file names the excluded replicate. Show the full-data result in the supplement. With 2 replicates a paired test has 1 degree of freedom.

The magnifier/hand icons below the plot only change the view, not the exports; use the Y axis tab.
